

Open-Source License Compliance

What the Dify license permits Wakeel to do commercially, the two conditions that require action before production rollout, and the recommended path.

1. Executive summary

Wakeel (وکیل) is built on **Dify**, an open-source LLM application platform by LangGenius, Inc. Dify is licensed under a **modified Apache License 2.0** (the "Dify Open Source License"). The license **expressly permits commercial use**, including using Dify "as a backend service for other applications" — which is exactly Wakeel's architecture. Two additional conditions apply, and both are manageable:

- **Multi-tenancy:** one Dify deployment may serve **one workspace (tenant)** without a commercial license. Wakeel's recommended per-entity deployment model satisfies this by design.
- **Dify console branding:** the Dify-provided console frontend must retain the Dify logo and copyright. Wakeel's own portal is unaffected; the embedded workflow editor requires one of three remedies before commercial go-live (Section 5).

Bottom line: Wakeel can be commercialised for Abu Dhabi government entities today under a per-entity deployment model, with one branding remedy applied — or a single commercial/white-label license obtained from LangGenius to clear both conditions at once.

2. The license in brief

Source: LICENSE file, Dify repository (github.com/langgenius/dify), © 2025 LangGenius, Inc.

*"Dify may be utilized **commercially**, including as a **backend service for other applications** or as an application development platform for enterprises."*

Condition (a) — Multi-tenant service: *"Unless explicitly authorized by Dify in writing, you may not use the Dify source code to operate a multi-tenant environment. ... one tenant corresponds to one workspace."*

Condition (b) — Logo and copyright: *"In the process of using Dify's frontend, you may not remove or modify the LOGO or copyright information in the Dify console or applications. This restriction is **inapplicable to uses of Dify that do not involve its frontend**." The frontend is defined as the web/ directory / "web" Docker image.*

All other rights and restrictions follow the standard Apache License 2.0. The license also notes Dify's interactive design is protected by an appearance patent, and that LangGenius may revise the license terms.

3. What Wakeel may do commercially — no permission required

ACTIVITY	STATUS	BASIS
Sell Wakeel deployments to government entities (setup, hosting, support, customisation fees)	Permitted	Commercial use expressly allowed
Operate the Wakeel portal (Build / Edit / Feedback / Deploy / Marketplace / Community) with full Wakeel & UAE branding	Permitted	Original Wakeel code; logo clause "inapplicable to uses ... that do not involve its frontend"
Use Dify's APIs as the engine (generation, workflows, knowledge, providers)	Permitted	"Backend service for other applications"
Modify and extend the backend / API source code	Permitted	Apache 2.0 terms
Sell pre-built marketplace workflows, consulting and managed services	Permitted	No restriction applies
Deploy one Dify instance per entity (each with a single workspace)	Permitted	Single-tenant per deployment — condition (a) not triggered

4. What requires a commercial license from LangGenius

ACTIVITY	STATUS	WHY
A central "Wakeel SaaS" where multiple entities are separate workspaces on one shared Dify deployment	License required	Condition (a): multi-tenant operation
Shipping the Dify console (embedded workflow editor) with Dify's logo/copyright removed or replaced	Remedy or license	Condition (b): console branding must remain
Re-implementing a visual canvas that copies Dify's interactive design	Caution	Appearance patent noted in license

5. Current Wakeel build — impact assessment

Compliant as-is

- Wakeel portal UI, server and branding (all original code)
- Single-workspace deployment (current pilot)
- All API-level usage: chat-to-build, testing, self-healing, knowledge, providers, marketplace installs

Action before commercial go-live

- The pilot's rebrand overlay currently replaces the Dify logo/copyright **inside the embedded console** (Edit tab). Choose one remedy:

R1. Restore Dify branding within the embedded editor only ("Powered by Dify" canvas) — zero cost. **R2.** Obtain LangGenius' commercial/white-label license — clears conditions (a) and (b) together. **R3.** Replace the embedded editor with an original, API-driven editing UI (larger build; observe the appearance-patent note).

6. Recommended path

1 Pilot (now)

Continue the current single-instance evaluation. No license exposure for internal assessment; schedule the branding remedy before any external or paid use.

2 Adopt per-entity deployments as the standard architecture

One Dify instance per government entity (Azure UAE North or sovereign cloud). This eliminates the multi-tenant condition entirely and aligns with UAE data-residency and security-accreditation requirements.

3 Apply branding remedy R1, and engage LangGenius in parallel

Restore Dify branding in the embedded editor immediately (compliant at zero cost), while procurement engages LangGenius for an enterprise/white-label license — the preferred end-state for a fully Wakeel-branded product and vendor support.

4 Maintain Apache 2.0 hygiene

Retain LICENSE and attribution notices in any distributed source; document modifications to the backend; track upstream license changes at each version upgrade.

7. Go-live compliance checklist

- ☐ Deployment model confirmed: one Dify instance per entity (single workspace per instance)
- ☐ Embedded editor branding remedy applied (R1) or commercial license executed (R2)
- ☐ LICENSE and attribution files included in any code distribution
- ☐ No copying of Dify's canvas interactive design into original UI (appearance patent)
- ☐ License re-reviewed at each Dify version upgrade (terms may be revised by LangGenius)
- ☐ Legal review completed by the entity's counsel

8. Reference — the two defined terms

TERM	LICENSE DEFINITION	WAKEEL MAPPING
Tenant	One workspace, providing separated data and configuration	One government entity = one workspace = one deployment
Frontend	The web/ directory / "web" Docker image (the Dify console)	Only the editor embedded in Wakeel's Edit tab; the Wakeel portal itself is out of scope

Disclaimer. This brief is an engineering interpretation of the Dify Open Source License (as read on 9 July 2026) prepared to support internal planning. It is not legal advice. The license permits LangGenius, Inc. to revise its terms; final determinations should be made by qualified legal counsel prior to any commercial commitment.
